

AMENDMENT TO THE CLAIMS

1. (currently amended): An attachment control device for use ~~with on~~ a power machine having a control computer for controlling operation of the power machine, the attachment control device comprising:

C1
BX
an electronic controller mounted on the power machine and coupled to the control computer and being spaced apart from the electronic controller, the electronic controller being electrically connected control computer to an attachment and configured to automatically receive an identification indication signal from thean attachment to which it is connected and provide a control signal to the control computer to control the attachment based on the identification signal.

2. (currently amended): A power machine having an engine and an attachment connected thereto, the power machine comprising:

a first input device positioned outside a cab portion of the power machine, the first input device including a first plurality of input mechanisms for controlling the attachment, wherein the first input device further includes a first engine start mechanism for starting the engine;

a second input device positioned inside the cab portion of the power machine, the second input device including a second plurality of input mechanisms for controlling the attachment, wherein the second input device further includes a second engine start mechanism for starting the engine; and

a control system operably connected to the power machine and operably connecting the first and second input devices, wherein the control system includes a lockout function

device that disables a predetermined set of operator-actuated functions based on a determination as to which of the first and second engine start mechanisms is used to start the engine.

3. (previously added): The power machine of claim 2, wherein the second input device is substantially disabled when the first engine start mechanism is used to start the engine.

4. (previously added): The power machine of claim 2, wherein the control system is configured so the power machine and the attachment are completely shut down if an attempt is made to use one of the first and second engine start mechanisms after the other of the first and second start mechanisms has already been used to start the engine.

5. (previously added): —The power machine of claim 2, wherein substantially all functions adapted to be controlled by an operator within the cab portion of the power machine, including functions associated with the second input device, are disabled when the first engine start mechanism is used to start the engine.

6. (previously added): —The power machine of claim 5, further including a shut down mechanism positioned within the cab portion of the power machine and for completely shutting down operation of the power machine and the attachment, wherein the shut down mechanism remains actuatable when the first engine start mechanism is used to start the engine.

7. (previously added): —The power machine of claim 5, wherein the power machine includes a traction mechanism for driving the power machine and wherein the traction mechanism is disabled when the

first engine start mechanism is used to start the engine.

Claims 8 and 9 (canceled)

10. (previously added): —The power machine of claim 2, wherein the first input device is substantially disabled when the second engine start mechanism is used to start the engine.

11. (previously added): —The power machine of claim 2, wherein substantially all functions adapted to be controlled by an operator outside the cab portion of the power machine, including functions associated with the first input device, are disabled when the second engine start mechanism is used to start the engine.

12. (previously added): —The power machine of claim 11, wherein the first input device further includes a shut down mechanism for completely shutting down operation of the power machine and the attachment, wherein the shut down mechanism remains actuatable when the second engine start mechanism is used to start the engine.

13. (previously added): —The power machine of claim 2, wherein the first input device remains enabled when the second engine start mechanism is used to start the engine.

14. (previously added): —The power machine of claim 2, wherein the attachment is a hand held tool and wherein the first input device is attached to the hand held tool.

15. (previously added): —A power machine having an engine, the power machine comprising:

a hydraulic power system connected to at least one valve

- member that is further connected to an actuation portion of an attachment;
- a first operator input device positioned outside a cab portion of the power machine and mounted to one of the power machine and the attachment, the first operator input device being configured to provide a first set of operator input signals based on a first plurality of operator inputs, said first operator input device further including a first engine start mechanism for starting the engine;
- an electronic controller operably coupled to the first operator input device and configured to control, based on the first set of operator input signals, a hydraulic fluid flow through said at least one valve and between the hydraulic power system and the actuation portion of the attachment;
- a second operator input device positioned inside the cab portion of the power machine and configured to provide a second set of operator input signals based on a second plurality of operator inputs and further including a second engine start mechanism for starting the engine;
- a main control computer operably coupled to the second operator input device and configured to control, based on the second set of operator input signals, a hydraulic fluid flow through said at least one valve and between the hydraulic power system and the actuation portion of the attachment;
- wherein the electronic controller is operably coupled to the main control computer and wherein the electronic controller controls said hydraulic fluid flow by actively controlling the main control computer; and
- wherein the electronic controller communicates with the main

control computer so as to disable a predetermined set of operator-actuated functions based on a determination as to which of the first and second engine start mechanisms is used to start the engine.

16. (previously added): —The power machine of claim 15, wherein the electronic controller further controls said hydraulic fluid flow by actively controlling said at least one valve.

17. (previously added): —The power machine of claim 15, wherein the electronic controller is configured to receive an indication signal from the attachment and provide a control signal to the control computer to control the hydraulic flow based on the identification signal.

18. (previously added): —The power machine of claim 17, wherein the electronic controller further controls the hydraulic flow actively controlling said at least one valve based on the identification signal.

19. (previously added): —The power machine of claim 15, wherein the second operator input device is substantially disabled when the first engine start mechanism is used to start the engine.

20. (previously added): —The power machine of claim 15, wherein substantially all functions adapted to be controlled by an operator within the cab portion of the power machine, including functions associated with the second operator input device are disabled when the first engine start mechanism is used to start the engine.

21. (previously added): —The power machine of claim 20, further including a shut down mechanism positioned within the cab portion

of the power machine and for completely shutting down operation of the power machine and the attachment, wherein the shut down mechanism remains actuatable when the first engine start mechanism is used to start the engine.

22. (previously added): -The power machine of claim 20, wherein the power machine includes a traction mechanism for driving the power machine and wherein the traction mechanism is disabled when the first engine start mechanism is used to start the engine.

Claim 23 (canceled)

24. (previously added): -The power machine of claim 15, wherein the first operator input device is substantially disabled when the second engine start mechanism is used to start the engine.

25. (previously added): -The power machine of claim 15, wherein substantially all functions adapted to be controlled by an operator outside the cab portion of the power machine, including functions associated with the first operator input device, are disabled when the second engine start mechanism is used to start the engine.

26. (previously added): -The power machine of claim 25, wherein the first operator input device further includes a shut down mechanism for completely shutting down operation of the power machine and the attachment, wherein the shut down mechanism remains actuatable when the second engine start mechanism is used to start the engine.

27. (previously added): -The power machine of claim 15, wherein the first operator input device remains enabled when the second engine start mechanism is used to start the engine.

CS
28. (previously added): —A method of operation for a power machine having a plurality of input devices including a first input device positioned outside a cab portion of the power machine, and a second input device positioned inside a cab portion of the power machine, wherein the first and second input devices respectively include a first and second engine start mechanism for starting an engine of the power machine, and wherein both devices are connected to a control system that is operably connected to the power machine and enables control of an attachment connected to the power machine, the method comprising:
making a determination as to which of said first and second engine start mechanisms started the engine; and
controlling the plurality of input devices based on the determination.

29. (previously added): —The method of claim 28, wherein making a determination comprises determining the first engine start mechanism started the engine, and wherein controlling the plurality of input devices comprises substantially disabling the second input device.

30. (previously added): —The method of claim 28, wherein making a determination comprises determining the first engine start mechanism started the engine, and wherein controlling the plurality of input devices comprises disabling substantially all functions adapted to be controlled by an operator within the cab portion of the power machine, including functions associated with the second input device.

31. (previously added): —The method of claim 28, wherein making a determination comprises determining the second engine start mechanism started the engine, and wherein controlling the

plurality of input devices comprises substantially disabling the first input device.

32. (previously added): -The method of claim 28, wherein making a determination comprises determining the second engine start mechanism started the engine, and wherein controlling the plurality of input devices comprises disabling substantially all functions adapted to be controlled by an operator outside the cab portion of the power machine, including functions associated with the first input device.

33. (previously added): The method of claim 28, wherein making a determination comprises determining the second start mechanism started the engine, and wherein controlling the plurality of input devices comprises maintaining the operability of both first and second input devices.

34. (new) The attachment control device of claim 1 and further comprising an input device spaced apart from the control computer and having an engine start mechanism for starting an engine on the power machine.

35. (new) The attachment control device of claim ~~36~~34 wherein when the engine start mechanism starts the engine, the input device controls flow of hydraulic fluid to the attachment based on the identification signal.
